

LinkedIn Bot

As a side project, with the goal of learning JavaScript before studying it in class, I decided to automate a repetitive and tedious task: adding connections on LinkedIn.

The first step was finding a unique element in LinkedIn: `"artdeco-modal__content"`

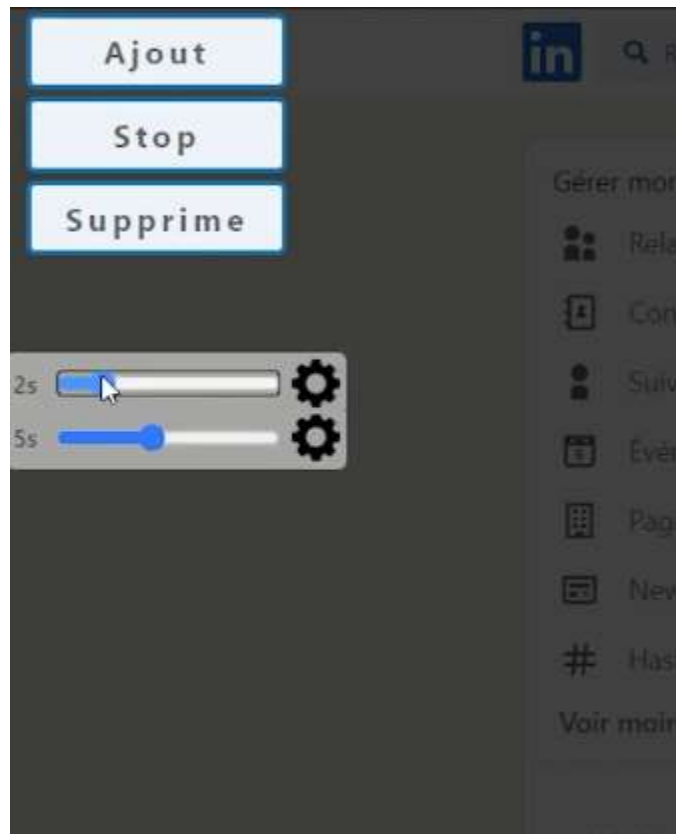

```
><div id="ember780" class="artdeco-modal_header ember-view">...</div>
><div id="ember781" class="artdeco-modal__content discover-cohort-recommendations-modal__content en
  <span class="ally-text">Fin du contenu de la boîte de dialogue.</span>
```

Then clicking on it's children:

```
buttons = document.querySelectorAll('.artdeco-modal__content
  footer .artdeco-button__text');
}
buttons[index++].click();
```

Interface for adding, stopping, deleting, and setting time intervals randomized to avoid bans.
