

# Refactoring of Websites

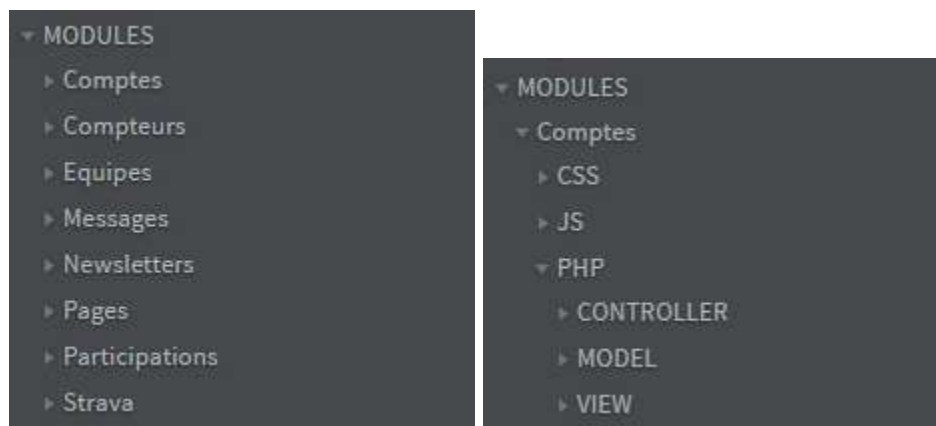

During my internship, I worked on numerous refactoring tasks. These ranged from upgrading very old websites with deprecated PHP versions to architectural refactoring. Here are a few examples:

## SaaS CRM for Hotels

I worked on the architectural changes for the launch of a CRM for a large hotel management group. Our goal was to create a solution that could easily incorporate modules based on the client's subscription choices. The initial architecture followed a regular MVC pattern, with all the files for each module grouped together. We transformed it into a modular system, where each module had its own MVC structure, along with its own CSS and JS files.

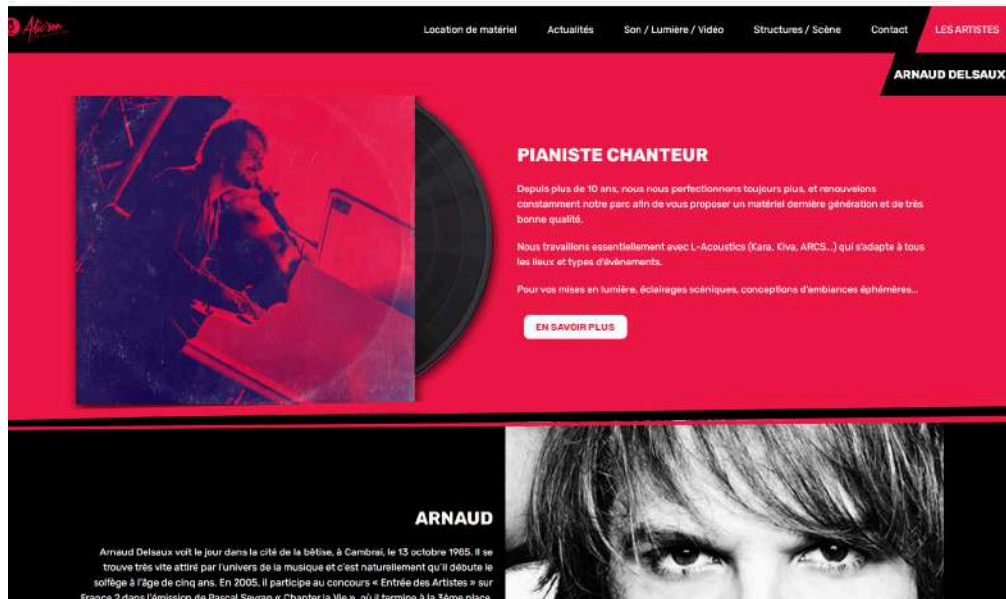

*Initial architecture.*

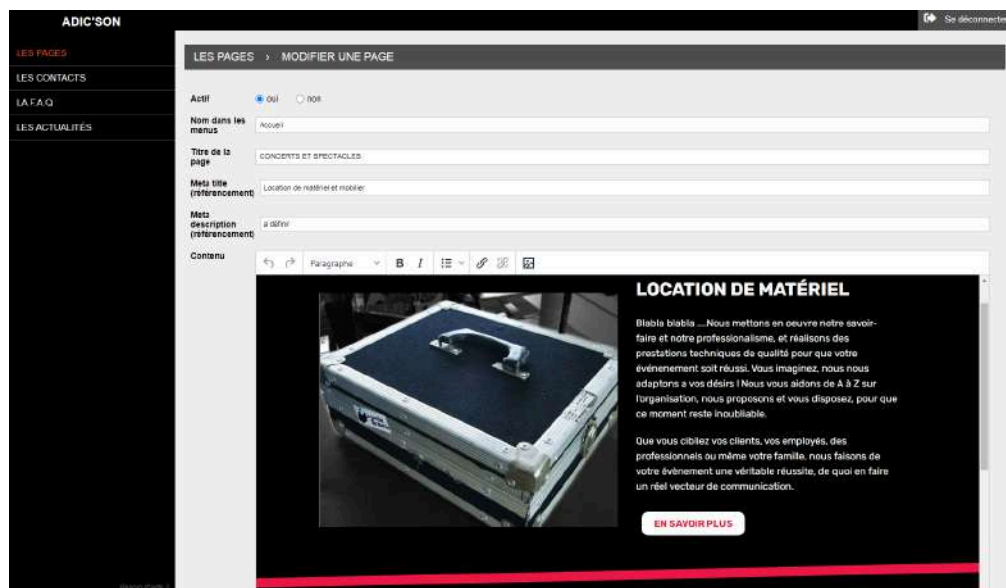

*Modules after refactoring.*

# Adic'son

A customer's website that had been a client since 2016. I updated the design, following the mockup provided by our designer. I also refactored the website's architecture to align it with the evolution of the framework.
