

# Restaurant's Menu

During my internship, one of the tasks assigned to me was to create a solution for a client who needed a way to modify multiple menus. The client required the ability to add products and categories to different menus, then generate PDFs to print for their customers. This provided an easy way for them to manage their menus without relying on an agency to make updates with each change.

Top left: Drink and Food, followed by the different menus.

Database with multiple associative datasets.

Preview before printing.

Once printed, each menu has its own format.
